

1. $O(\log n)$ – j doubles each iteration
2. $O(n)$ – j iterates n times, if only adds a constant amount of work each iteration
3. $O(n^2)$ – i iterates n times and j iterates n times each i iteration, second loop is constant
4. $O(n^2)$ – i iterates n times and j iterates $i/2$ times, still n^2 , second loop is constant
5. $O(n)$ – i iterates n times and second loop runs constant (1000000) time
